

Sean Whitesell

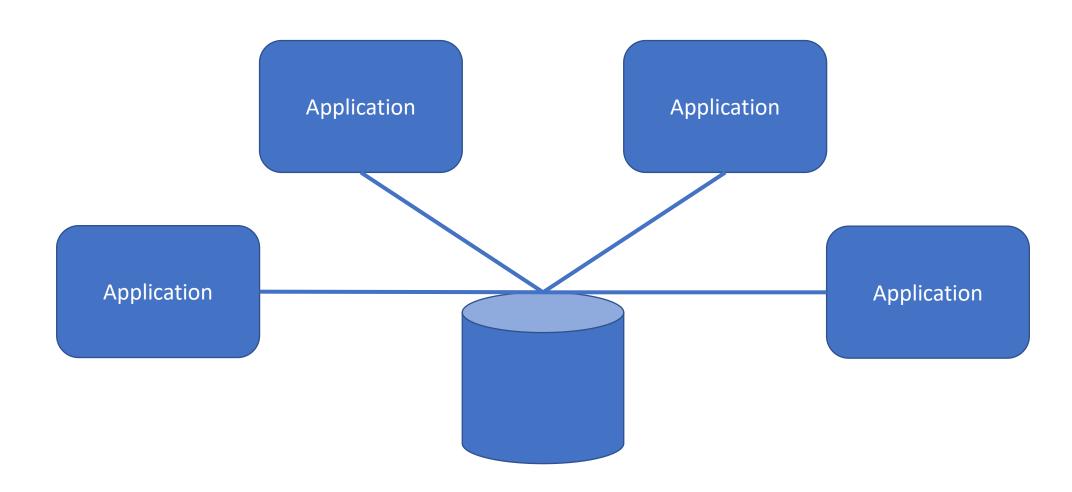

So, what we going to do?

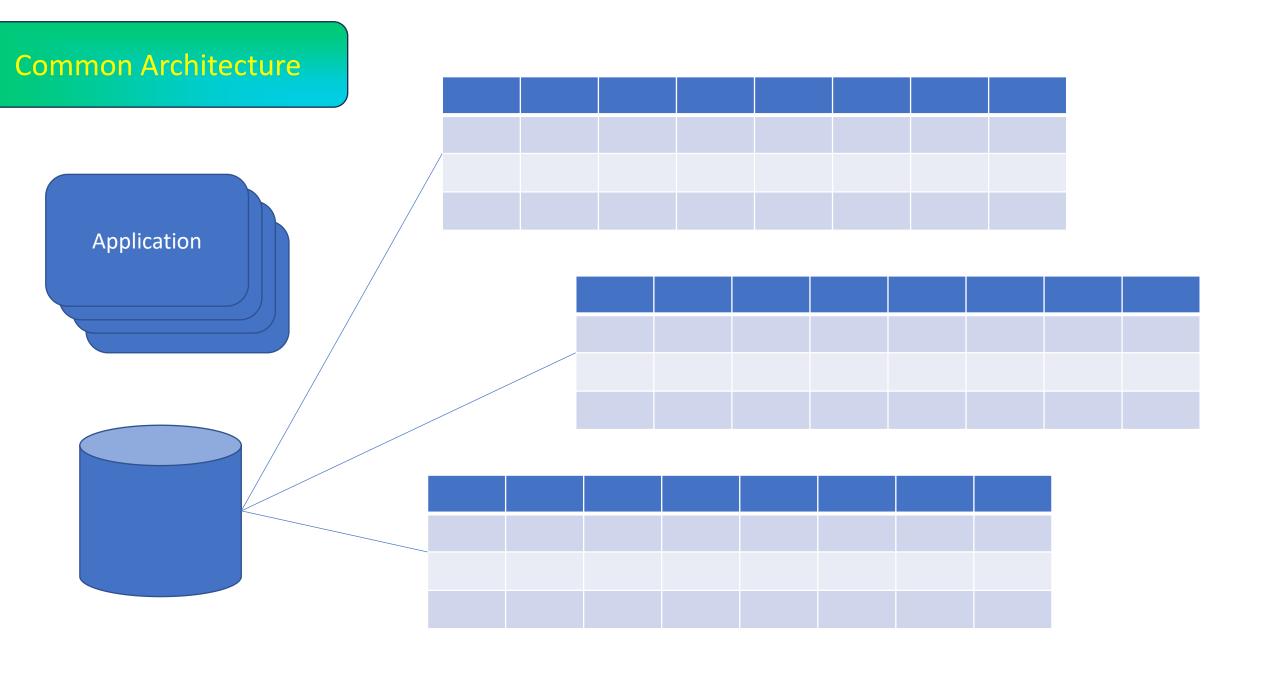

Agenda:

- Common Architecture
- Data Model
- CQS
- CQRS
- Eventual Consistency
- Views
- Event Sourcing
- CQRS + Event Sourcing

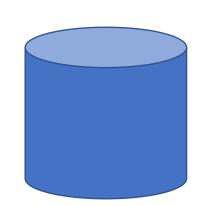

Application

Data Access Layer

Could be inside the app or in a DLL/package.

```
public class InsuranceClaim
{
   public void CreateInsuranceClaim( ClaimInfo information )
   public ClaimInfo GetInsuranceClaimInfoById( int id )
}
public class ClaimInfo
{
}
```

```
public class InsuranceClaim
  PayInsuranceClaim( ClaimInfo information )
  Approve Insurance Claim (Claim Info information)
  RejectInsuranceClaim(ClaimInfo information)
 public ClaimInfo GetInsuranceClaimInfoById( int id )
public class ClaimInfo
```

```
public class InsuranceClaim
  PayInsuranceClaim( ClaimInfo information )
 ApproveInsuranceClaim( ClaimInfo information )
  RejectInsuranceClaim( ClaimInfo information)
 public ClaimInfo GetInsuranceClaimInfoById( int id )
public class ClaimInfo
```

Update Date

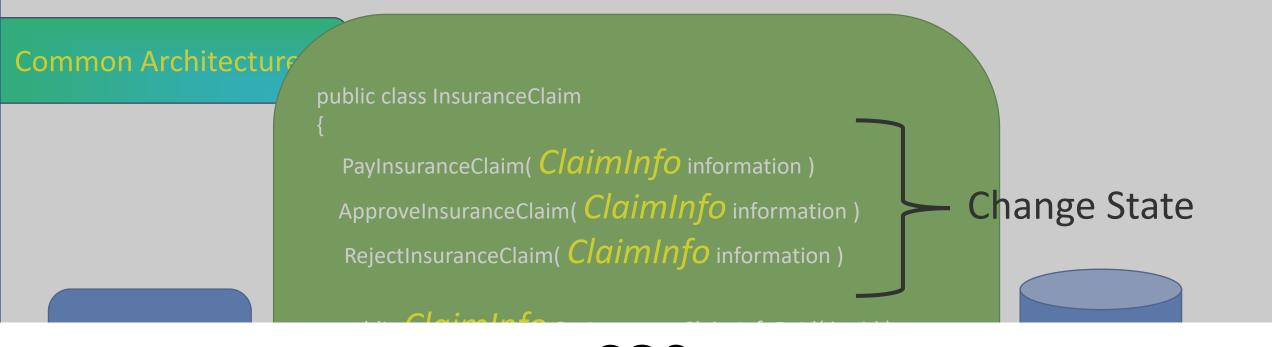

```
public class InsuranceClaim
  PayInsuranceClaim( ClaimInfo information )
                                                        Change State
 ApproveInsuranceClaim( ClaimInfo information )
  RejectInsuranceClaim( ClaimInfo information )
 public ClaimInfo GetInsuranceClaimInfoById( int id )
public class ClaimInfo
                                              Retrieve State
```

CQS Command – Query – Separation

Retrieve State

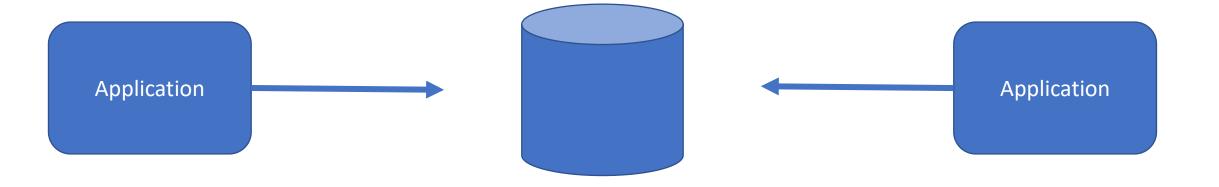

CQS Command – Query – Separation

Retrieving data should not cause data to be changed.

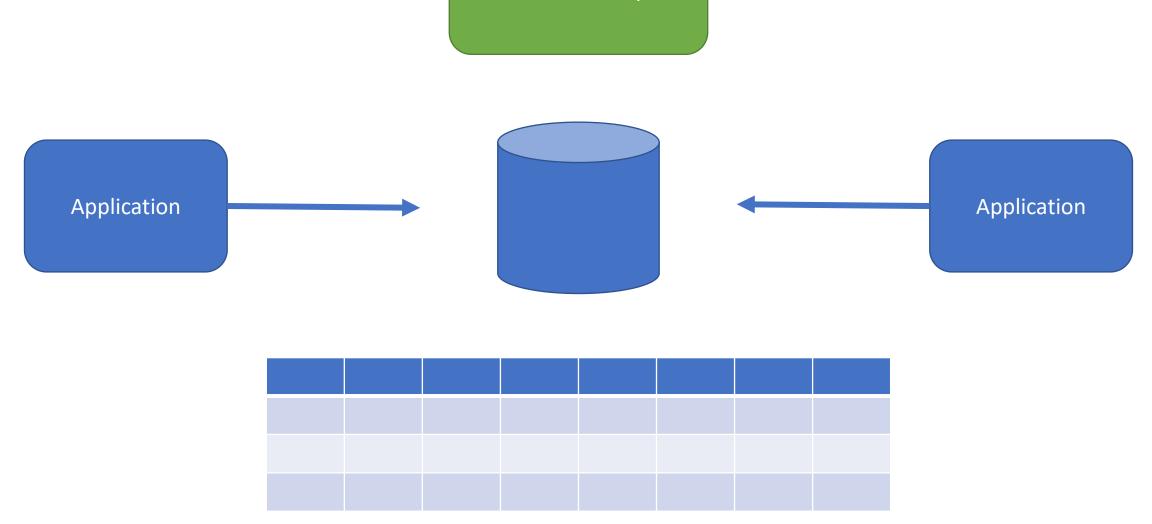

CQS
Command – Query – Separation

Retrieving data should not cause data to be changed.

Data Access Layer

Pain Points

Data Access Layer

Application

Application

Application

1. Code change contention

Application

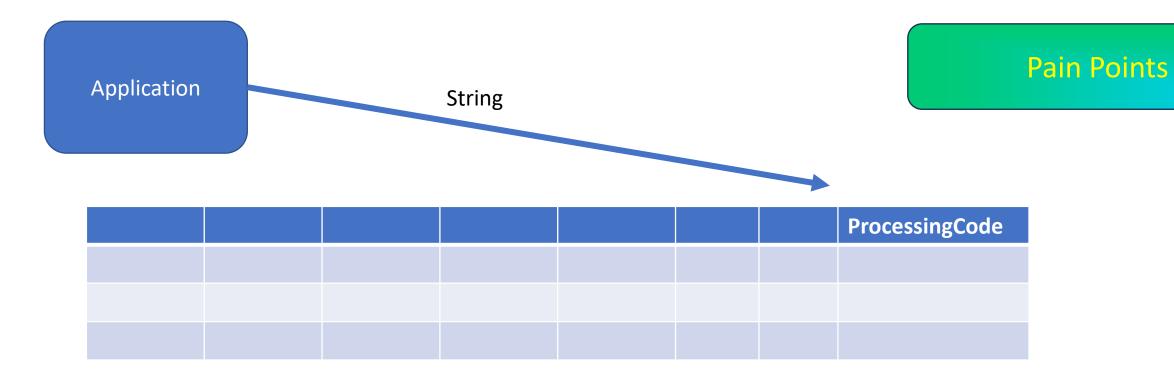

- 1. Code change contention
- 2. Performance differences

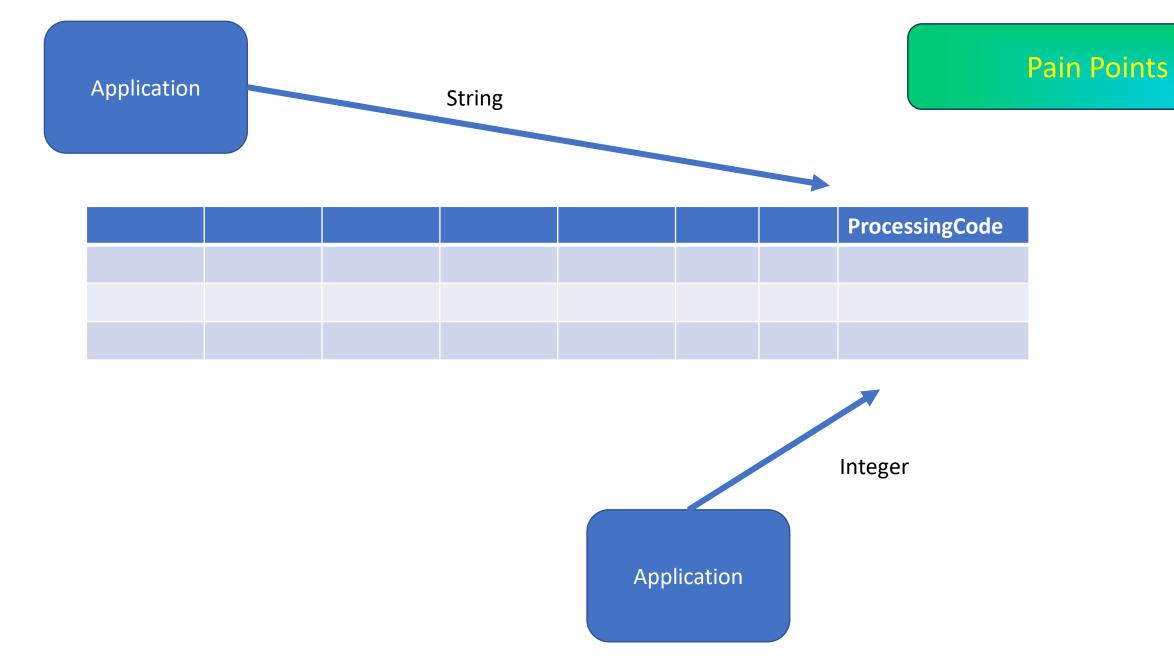

Application

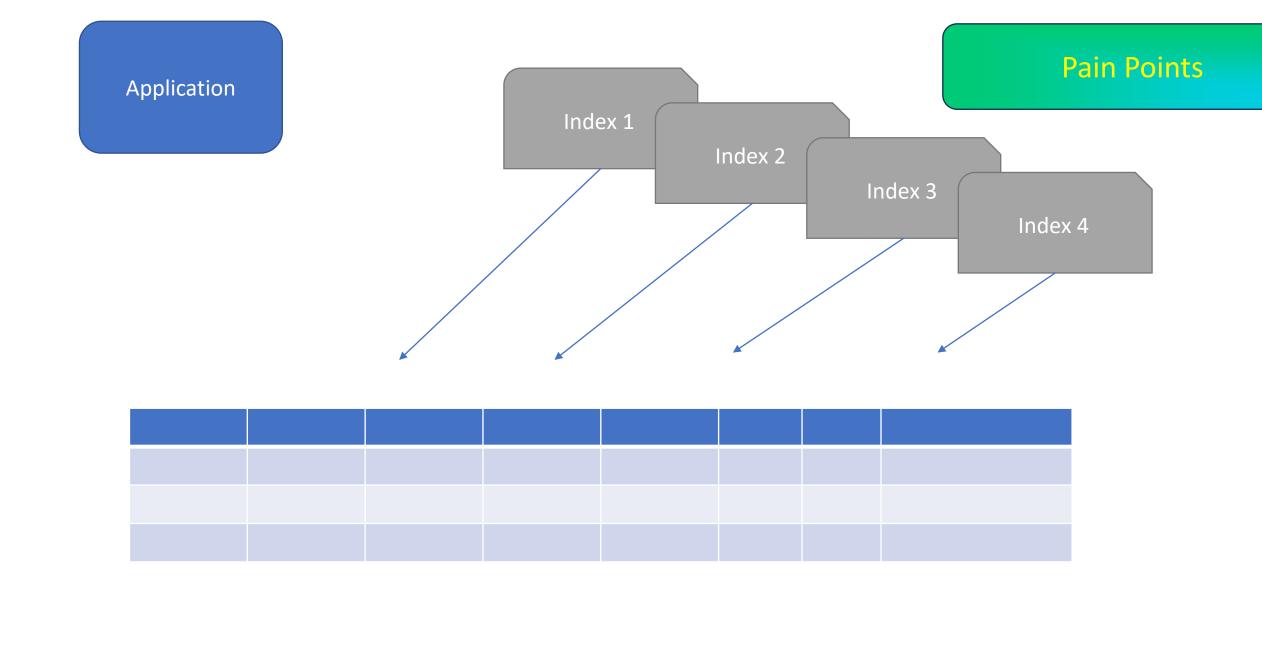

- 1. Code change contention
- 2. Performance differences
- 3. Unclear schema ownership

Application

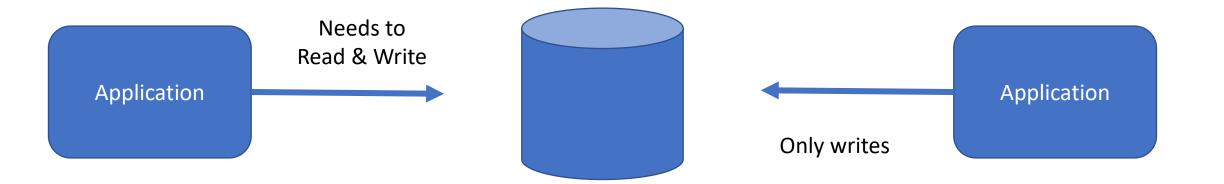

- 1. Code change contention
- 2. Performance differences
- 3. Unclear schema ownership
- 4. May need to consider duplicating code to allow apps to evolve independently

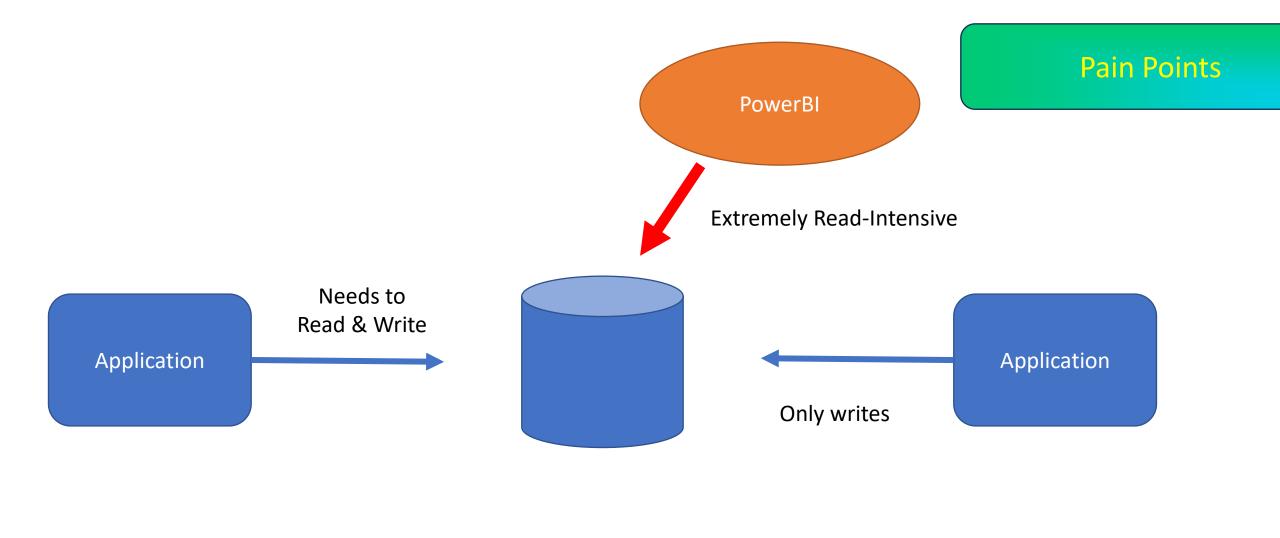

Pain Points

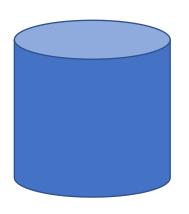

What is this "Data Store" of which you speak?

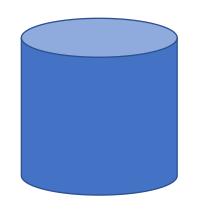

A database is a data store. But a data store is not necessarily a database.

A database is a data store. But a data store is not necessarily a database.

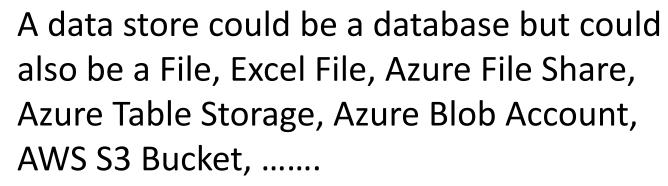

A database has an "engine" that maintains data integrity among many other functions.

A database is a data store. But a data store is not necessarily a database.

A database has an "engine" that maintains data integrity among many other functions.

Forecasted and Actual Temperature Data

Time	Forecasted	Actual
6:00:00	76	77
7:00:00	76	75
8:00:00	65	62
9:00:00	60	56

Analytics!

Forecasted and Actual Temperature Data

Time	Forecasted	Actual	Variation
6:00:00	76	77	1
7:00:00	76	75	-1
8:00:00	65	62	-3
9:00:00	60	56	-4

When to consider using Event Source?

When to consider using Event Source?

Network Performance
Audit Compliance
Financial IoT Legal
Healthcare Telemetry
Inventory
Insurance Analytics
Retail Government
Supply Chain

*not exhaustive list

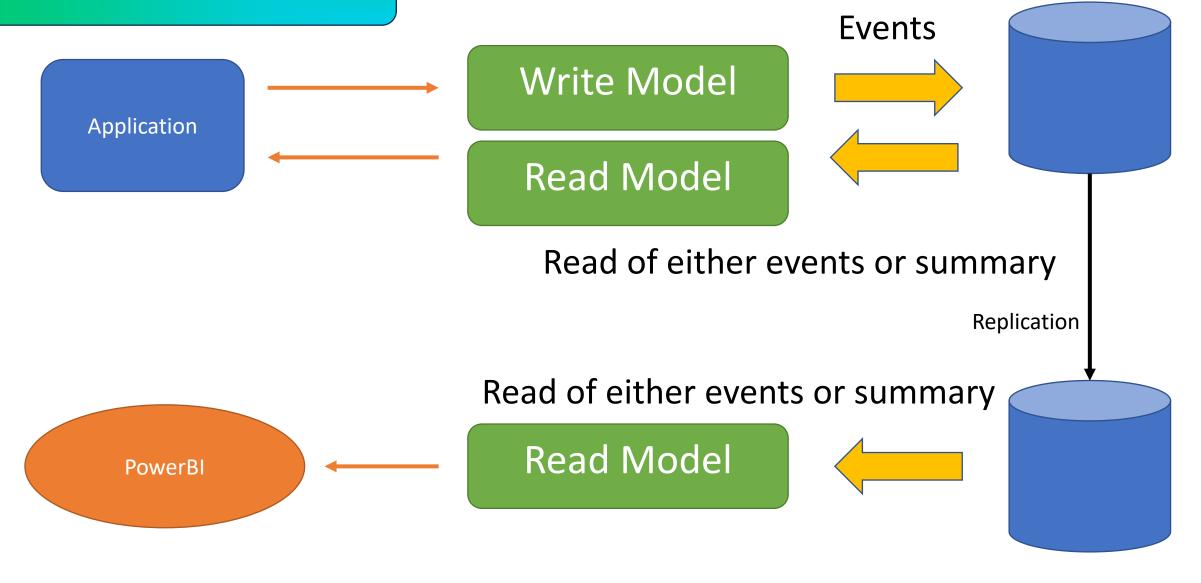

Key point about Event Sourcing.

Key point about Event Sourcing.

Use when you need to replay the change events as the "source of truth."

CQRS + Event Sourcing

C Q R S w/ Event Sourcing

1. At Rest vs In Transit

Data that is stored on disk either spinning hard drive or solid-state is considered "at rest".

Data in the network to or from a data store or between applications like microservices is considered "in transit".

SSL connections is one way of encrypting data in transit between a source and destination.

- 1. At Rest vs In Transit
- 2. Key Management

Data encrypted at rest uses an encryption key.

Most cloud providers do not allow you access to this key. Instead, they offer you a "customer managed key". This CMK is a "key encrypting key." It is used to encrypt the key that is used for encrypting the data at rest.

- 1. At Rest vs In Transit
- 2. Key Management
- 3. Access and Authorization

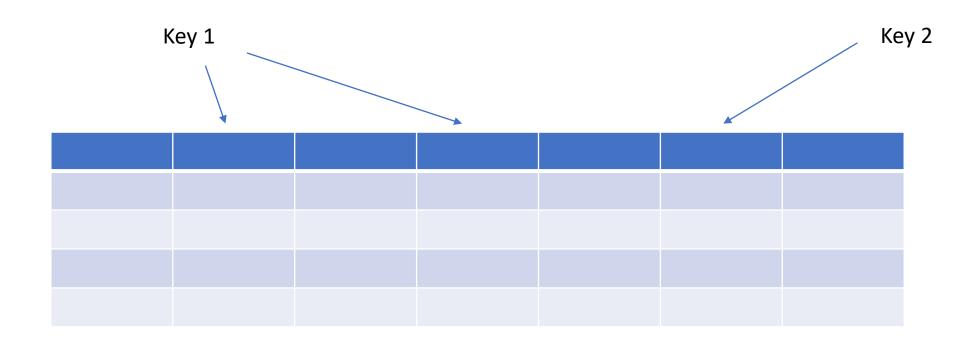

Some databases, like SQL Server, offer Row-Level Security.

This Row-Level Security allows for control of who has access to see any data at a row-by-row level.

- 1. At Rest vs In Transit
- 2. Key Management
- 3. Access and Authorization
- 4. Columnar Encryption

Some databases, like SQL Server, offer

Transparent Data Encryption. This uses a predefined key you set up for how the data in specified columns are encrypted.

- 1. At Rest vs In Transit
- 2. Key Management
- 3. Access and Authorization
- 4. Columnar Encryption
- 5. Compliance

Data residency laws are becoming more prominent.

GDPR - General Data Protection Regulation CCPA - California Consumer Privacy Act PII – Personally Identifiable Information
